SKILLS

Programming
Dart · Flutter · PocketBase · Arduino

Networking & infrastructure
Network design and management · Infrastructure budgeting

Databases
Database design

Operating systems
Linux, Windows and macOS

Hardware & support
Equipment repair and diagnostics · Technical support · Electronics

Design & fabrication
Autodesk Fusion 360 · 3D printing · Laser cutting (RDWorks)

LANGUAGES

Spanish · Native

English · C1 (certified)

PROFILE

I consider myself a person deeply passionate about technology, constantly learning new concepts. I am in the final year of my technical degree in Computing. During my studies, I have worked on projects that contributed to my training, focusing mainly on software development and systems management. Outside of school, I have done projects and training related to programming, with a special focus on Flutter. I plan to continue with a Systems Engineering degree to keep expanding my knowledge and specialize in technologies that interest me, such as low-level programming and artificial intelligence.

EXPERIENCE

Professional Internship
Mar. 2026 – Present
EEST N°2 de Lanús "Dr. Valentín Alsina"

- Diagnosing and repairing computers and laptops to donate them to other institutions.
- Designing 3D objects in Autodesk Fusion 360, from scratch or from existing plans.
- Installing cameras and network cabling; general infrastructure maintenance.

PROJECTS

Digital Inventory Management System
Mar. 2026 – Present
Dart, Flutter, PocketBase

- Proposed and lead the digitalization of the school's tool room, which had no record of its tools or their movements.
- The app lets users register items, generate label sheets, register loans by scanning barcodes or manually, automatically calculate loan due dates, issue ID cards for users and send them by email, and view the movement history, among other features.
- The system is constantly updated, fixing bugs and adding new quality-of-life features.

Ultrasonic Radar with Visual Interface
Jun. 2025 – Oct. 2025
Arduino, Processing, 3D printing

- Led the development of a device with Arduino, a servo and an ultrasonic sensor that detects the distance and position of objects (40 cm range, 180° sweep), with an audible alarm, an indicator light and visualization in Processing. The radar's body was modeled and 3D printed.
- Designed as the foundation for an assisted-walking system for visually impaired people. Presented at several regional showcases in the "Innovation" category.

EDUCATION

IT Technician – Personal and Professional Computing
2022 – Dec. 2026
EEST N°2 de Lanús "Dr. Valentín Alsina"

Advanced Flutter Course
Partially completed
Udemy – Fernando Herrera
